

## ECMAScript Exercise 2

### Exercise:

Create a prototype for a **Car** with properties for **make**, **model**, and **year**. This prototype should have a method called **getCarInfo()** that prints the car's details.

Next, create another prototype **ElectricCar** that inherits from **Car** and adds a **batteryCapacity** property, as well as a method **getBatteryInfo()** that prints the battery's capacity.

Lastly, create instances of both **Car** and **ElectricCar** to demonstrate their functionality.
